Project Description:

The client needed 728 tons of rock screening and 7,956 cubic feet of wood trim removed without excavating the natural soil within 3 days in early January. Problem: the weight of the rock screening nearly tripled after being wet and frozen from min January which put the haul away cost well over budget. Solution: We took an environmentally friendly approach and reached out to local parks to recycle the rock screening to repair potholes and ditches. We successfully recycled 628 tons of rock screening and had the 100 tons disposed of due to contamination from the soil which mixed in and could not be recycled. We then graded the soil for reseeding. The entire process was completed on time, and within the projected budget cost.
